

Here we start with a print statement, just to get things going.

```
print('Get those dogs ready')
```

```
def bark(name, weight):
```

```
    if weight > 20:
```

```
        print(name, 'says WOOF WOOF')
```

```
    else:
```

```
        print(name, 'says woof woof')
```

```
bark('Codie', 40)
```

```
print("Okay, we're all done")
```

And then we have our bark function definition.

And then we're going to call the bark function with the arguments Codie and 40.

And finally we use a print statement to say we're done.

Pretend you are the Python interpreter. Start at the top of the code and mentally step through and execute each line. Are there any steps that are unclear to you?

#Will print

Get those dogs ready

#Will create a function(bark) with two parameters(name , weight)

#if else condition

#function calling with parameters value.

#Will print

Codie says WOOF WOOF

#Will print

Okay, we're all done
